

Departmental Store Management

Our project is about a Departmental Store Management System, which allows users to manage and track product information within a departmental store. The system provides several functions including:

- adding products
- selling products
- searching for products
- listing sold-out goods
- listing sold good quantities
- deleting products
- edit products

These functions enable efficient inventory management and monitoring of product availability.

Here is how each function works:

1. ADD FUNCTION

This function allows the user to add a new product to the departmental store. Then it allows the user to enter the product ID, name, price, and quantity. It checks if the maximum number of products has been reached. After that, the product information is stored in the products array, and the number of products is incremented. as well as a duplication prevention function that checks if the user is trying to enter the same ID for a different product which prompts an error message

2. SEARCH FUNCTION

This function enables the user to enter and search for a product by its ID. It then iterates through the "products" array to find a matching ID, if a match is found, the details of the product (ID, name, price, and quantity) are displayed. If no match, a message is displayed informing the user that the product was not found.

3. SELL FUNCTION

This function allows the user to sell a specific quantity of a product. First the user enters the ID of the product they want to sell. If the product is found, it displays its details and asks for the quantity to sell. But if the quantity exceeds the available quantity, it informs the user that there isn't enough product to sell. Otherwise, the quantity of the product is updated by subtracting the sold quantity, and a success message is displayed. If the product is not found an error message will appear.

4. SOLD OUT GOODS FUNCTION

This function lists the names of products that are sold out (quantity = 0). It iterates through the products array and checks if the quantity of each product is zero. If a product is sold out, it displays its name, otherwise, it informs the user that there are no sold out products.

5. SOLD OUT QUANTITY FUNCTION

This function lists the details (ID, name, price, and quantity) of products that have a quantity of 0. It loops through the products array and displays the details of each product. If no sold out goods are found, a message indicating the absence of sold-out products is displayed.

6. Deleting products

This function prompts the user to enter an ID searching for the products if the product is not found an error message will appear if not the product will be deleted according to its id

7. Edit products

This function prompts the user to enter an id while searching for the products if the product is not found an error message will appear if not the user will be asked to enter the new info about the product (id , name, quantity, price)
